

# Query Processing in STING and Its Analysis

---

- ❑ To process a region query
  - ❑ Start at the root and proceed to the next lower level, using the STING index
  - ❑ Calculate the likelihood that a cell is relevant to the query at some confidence level using the statistical information of the cell
  - ❑ Only children of likely relevant cells are recursively explored
  - ❑ Repeat this process until the bottom layer is reached
- ❑ Advantages
  - ❑ Query-independent, easy to parallelize, incremental update
  - ❑ Efficiency: Complexity is  $O(K)$ 
    - ❑  $K$ : # of grid cells at the lowest level, and  $K \ll N$  (i.e., # of data points)
- ❑ Disadvantages
  - ❑ Its probabilistic nature may imply a loss of accuracy in query processing
