

# Distributional hypothesis

*“You shall know a word by the company it keeps.”*

— Firth, 1957.

- Use a sliding window of a fixed size
- Compute word co-occurrences  $n_{uv}$
- **Better:** Pointwise Mutual Information:

$$PMI = \log \frac{p(u, v)}{p(u)p(v)} = \log \frac{n_{uv}n}{n_u n_v}$$
